READ INSTRUCTION

Submit your code via github.com

Use expressjs with mongodb or mysql for this. You need design database tables yourself based on the question.

- a) We have two entities "candidate" and "test_score"
- b) candidate has properties name, email address
- c) Every candidate has to give 3 tests like "first_round", "second_round", "third_round" and scoring for every test is done out of 10.

Now using expressjs, only need to create api to do the following

- a) Insert a candidate into database
- b) Assign score for a candidate based on the test
- c) Api to get highest scoring candidate and average scores per round for all candidates

As submission for this test, send your source code on github and send the api url with payload or request information

You can source information from google as needed.
